# 학습 목표

---

재귀함수를 구현하는 과정을 stack을 통해 이해하고  
memoization을 활용할 수 있다

# Data Structures in Python

## Chapter 4

- Recursion Concepts
- **Recursion Stack and Memoization**
- Recursive Algorithms
- Recursive Graphics
- Exercise - Stacking boxes

# Agenda

---

- Recursion and Stack
  - The Fibonacci Sequence
  - Using Memoization

# Recursion and Stack

- Example: Find the tallest person in a group of  $N > 0$  students

```
def find_tallest(Group_of_students)
    tallest = Take any student from group;
    Repeat until nobody left
        Take next student from group
        If student is taller than tallest then
            tallest = student
    Return tallest
```

Iterative solution

# Recursion and Stack

- Example: Find the tallest person in a group of  $N > 0$  students

[162, 155, 169, 157]

Recursive  
solution

```
def find_tallest(students):  
    if len(students) == 1:  
        return students[0]  
  
    a = students[0]  
    b = find_tallest(students[1:])  
    return a if a > b else b
```

Recursive  
solution

```
def find_tallest(Group of students)  
    If only one student in group  
        return this student  
    else  
        StudentA = Take one student from group  
        StudentB = find_tallest(Remaining Group)  
        return the taller person of StudentA and StudentB
```

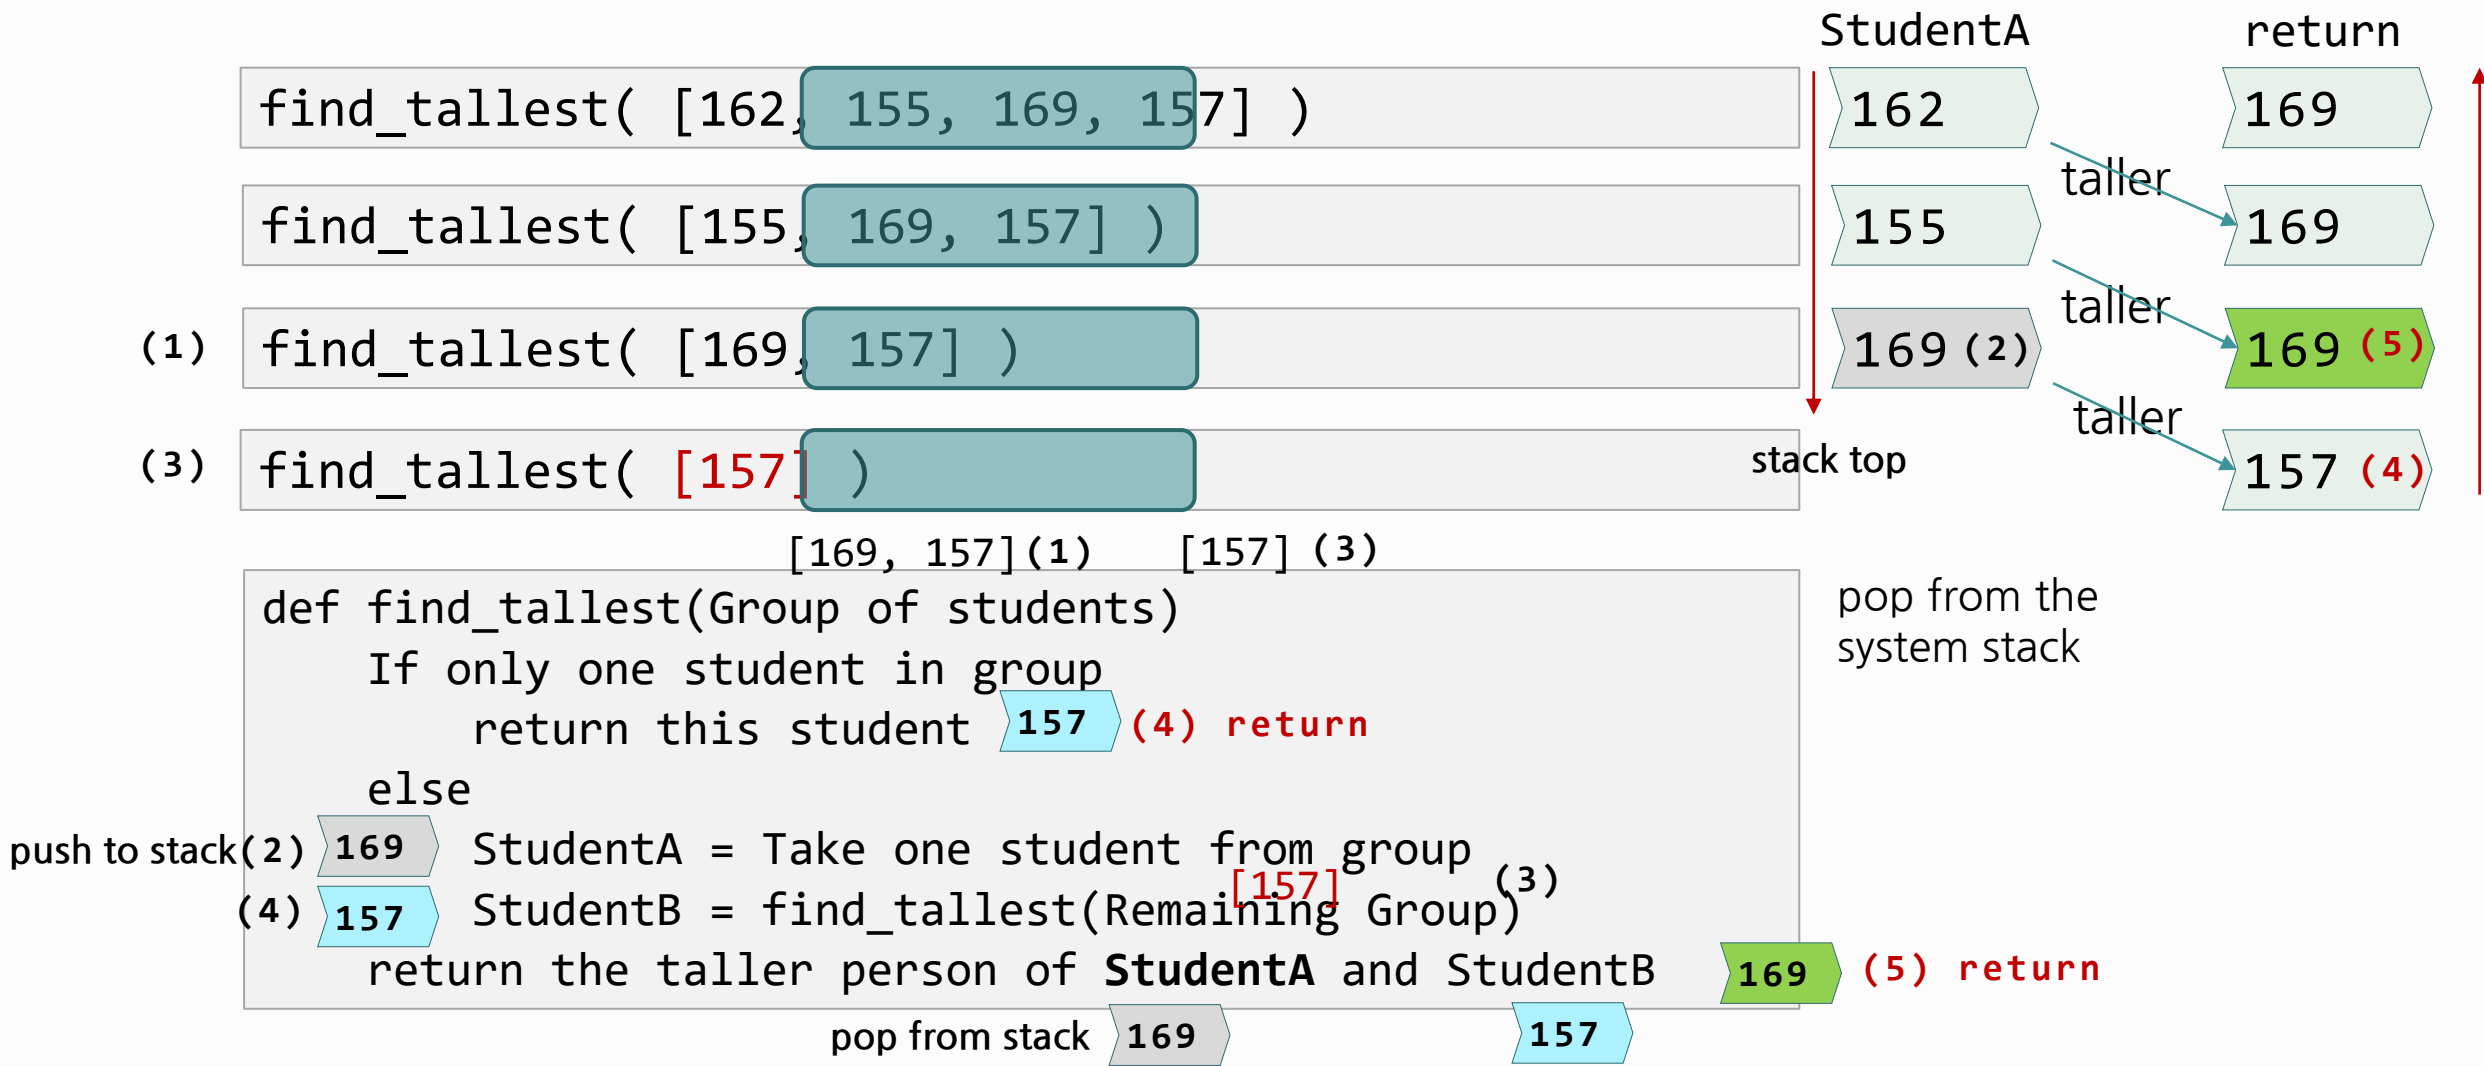

# Recursion and Stack

- Example: Find the tallest person in a group of  $N > 0$  students

# Recursion and Stack

- Example: Find the tallest person in a group of  $N > 0$  students

# Recursion and Stack

- Example: Find the tallest person in a group of  $N > 0$  students

[162, 155, 169, 157]

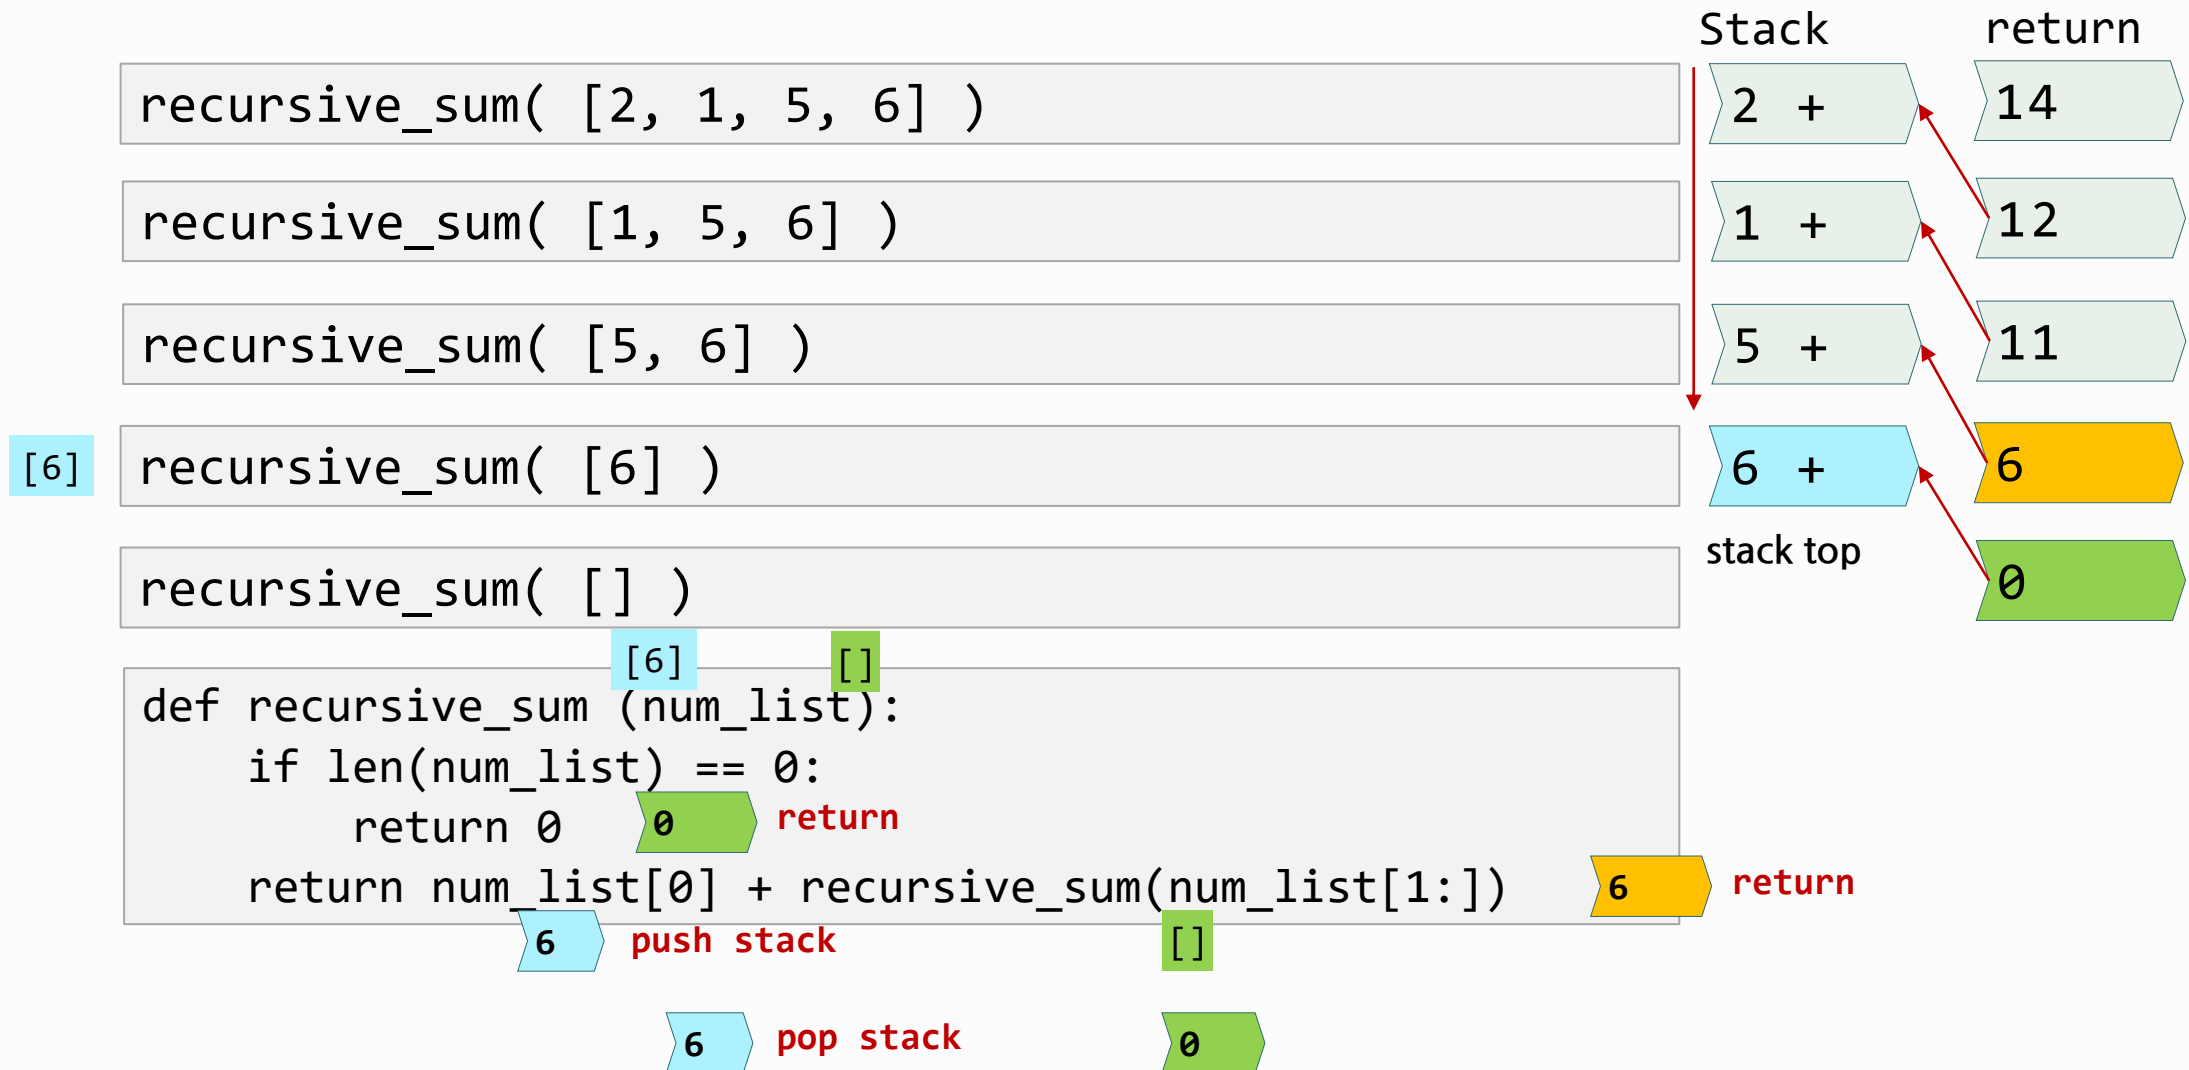

```
def find_tallest(students):  
    if len(students) == 1:  
        return students[0]  
  
    a = students[0]  
    b = find_tallest(students[1:])  
    return a if a > b else b
```

```
def find_tallest(Group of students)  
    If only one student in group  
        return this student  
    else  
        StudentA = Take one student from group  
        StudentB = find_tallest(Remaining Group)  
        return the taller person of StudentA and StudentB
```

## Exercise: Recursion and Stack

- Get the recursive sum by taking the first number + the sum of the rest of the list.

# The Fibonacci Sequence

---

- Describes the growth of an idealized (biologically unrealistic) rabbit population, assuming that:
  - Rabbits never die.
  - A rabbit reaches sexual maturity exactly two months after birth, that is, at the beginning of its third month of life.
  - Rabbits are always born in male-female pairs.
  - At the **beginning** of every month, each sexually mature male- female pair gives **birth** to exactly one male-female pair.

# The Fibonacci Sequence

- Problem:
  - How many pairs of rabbits are alive in month  $n$ ?
- Example:
  - $\text{rabbit}(5) = 5$
- Recurrence relation
  - $\text{rabbit}(n) = \text{rabbit}(n-1) + \text{rabbit}(n-2)$

# The Fibonacci Sequence - Recursive Definition

- Base cases
  - rabbit(2), rabbit(1)
- Recursive case
  - $\text{rabbit}(n) = \begin{cases} 1 & \text{if } n \text{ is 1 or 2} \\ \text{rabbit}(n-1) + \text{rabbit}(n-2) & \text{if } n > 2 \end{cases}$
- Fibonacci sequence
  - The series of numbers fibo(1), fibo(2), fibo(3), and so on
  - The sequence of numbers fibo(n) for all n is called **Fibonacci Sequence** or **Fibonacci numbers**.

```
def fibo(n):  
    """Assume n >= 0 """  
    if n < 2:  
        return 1  
    return fibo(n-1) + fibo(n-2)
```

## The Fibonacci Sequence - Coding Exercise

---

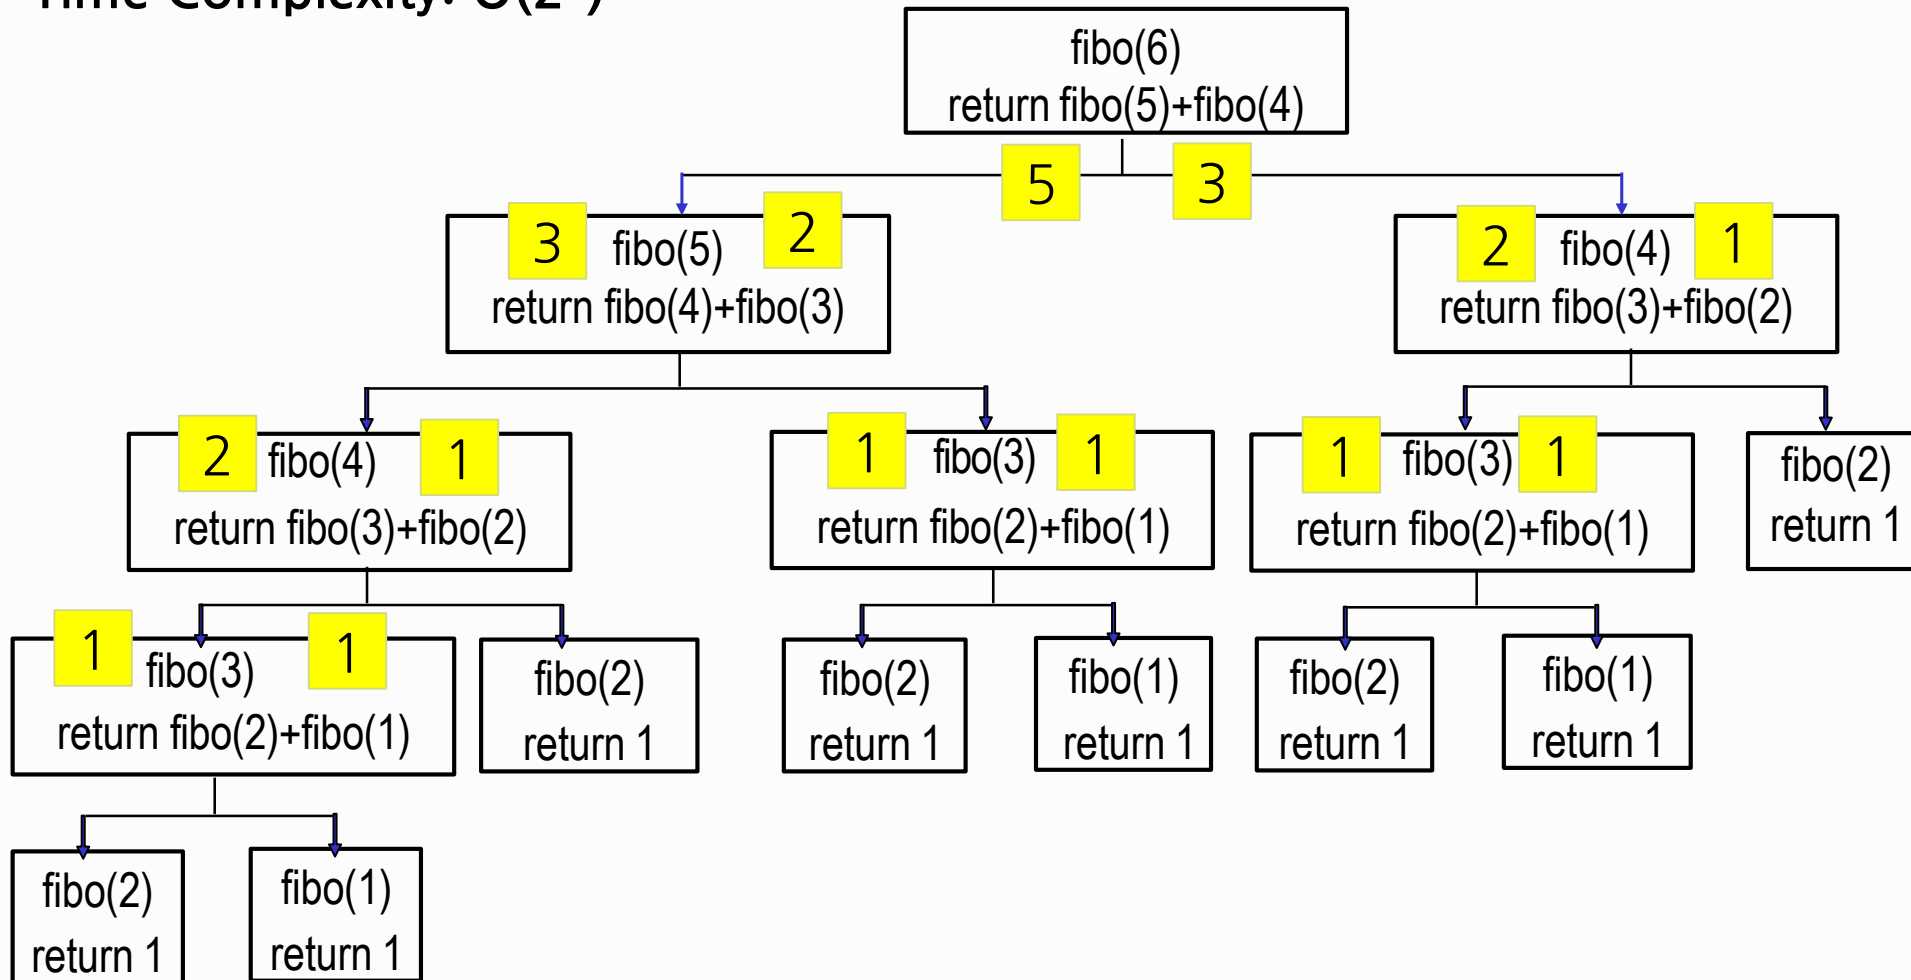

- Rewrite the fibo() using a ternary operator to replace 'None'.

```
def fibo(n):  
    """Assume n >= 0 """  
    return None
```

```
def fibo(n):  
    """Assume n >= 0 """  
    if n < 2:  
        return 1  
    return fibo(n-1) + fibo(n-2)
```

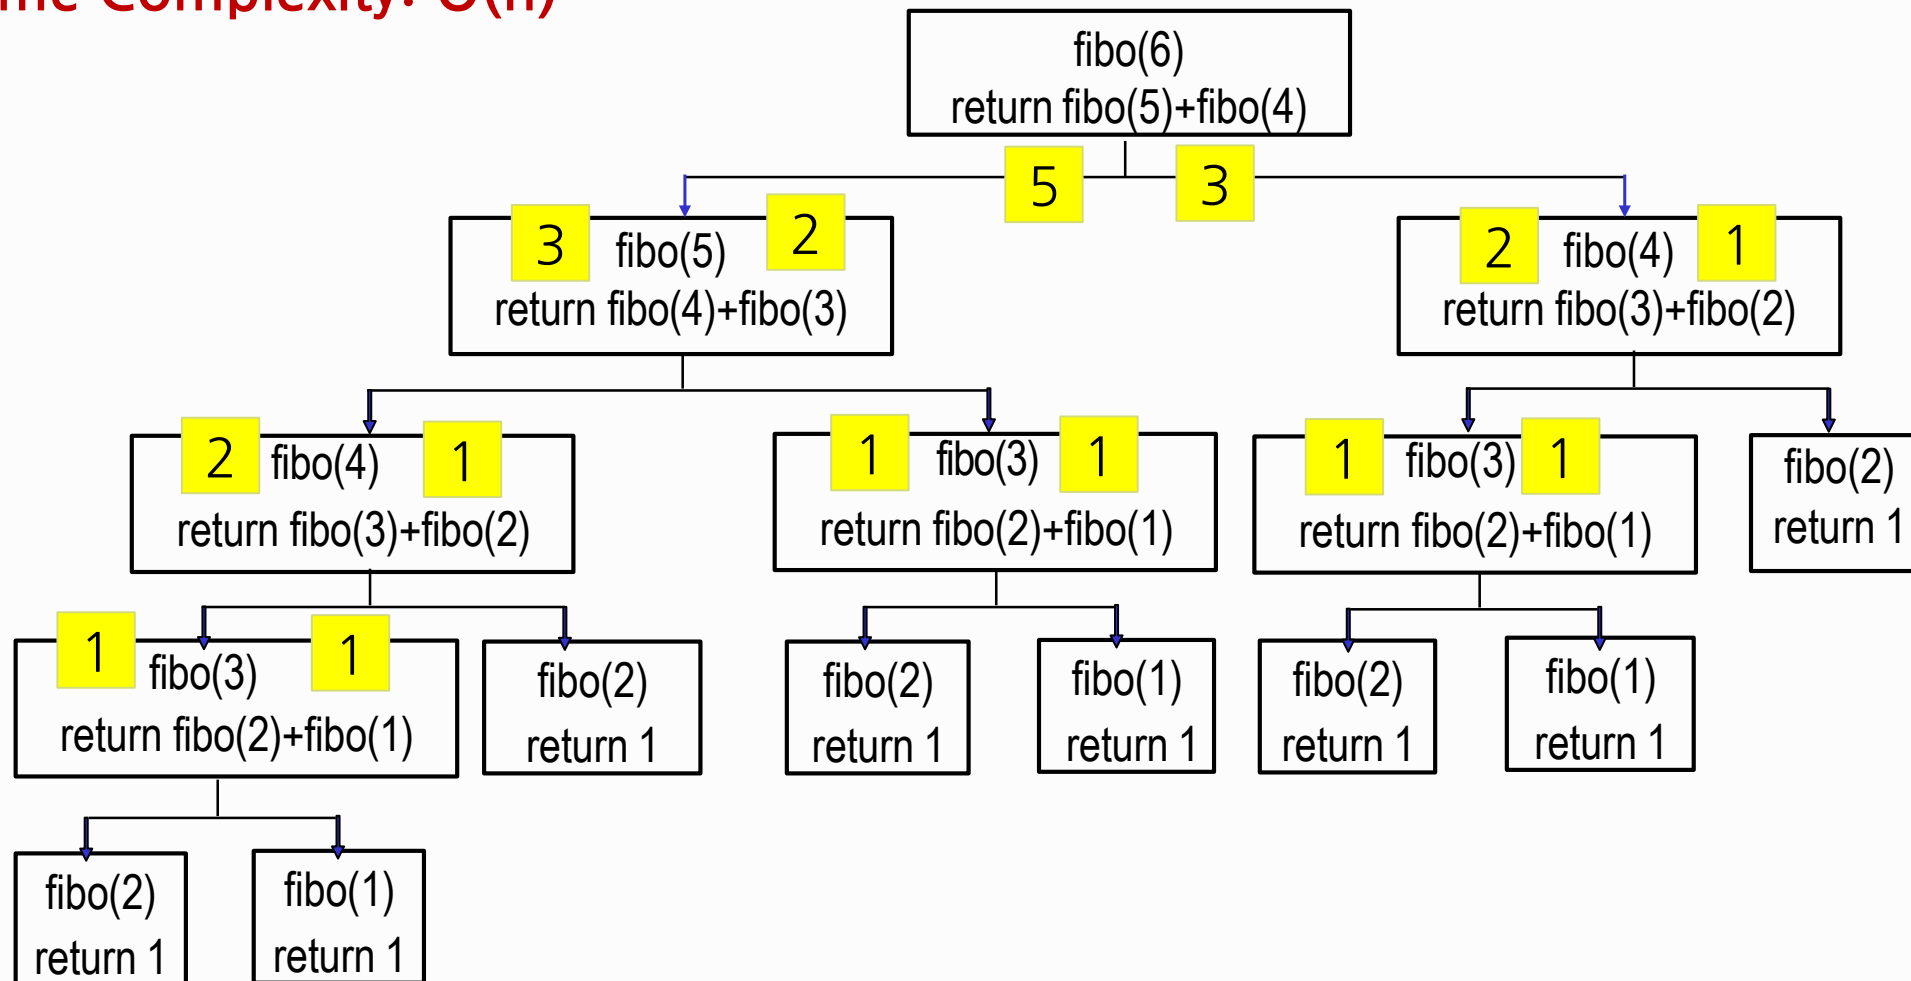

# The Fibonacci Sequence - Examples

- $\text{fib}(6) = 8$ 
  - How many times were  $\text{fib}(2)$  and  $\text{fib}(3)$  called to compute  $\text{fib}(6)$ , respectively?
  - **Time Complexity:  $O(2^n)$**

## The Fibonacci Sequence - Examples

- Rather computing the same terms repeatedly, just save them in a set and reuse them whenever necessary. This technique is called **memoization**, not **memorization**.
- **Time Complexity:  $O(n)$**

# The Fibonacci Sequence - Examples

- Fibonacci Tiling

# The Fibonacci Sequence - Examples

- Fibonacci Spiral

# The Fibonacci Sequence - Examples

- Fibonacci and the Golden Ratio -  
<https://www.youtube.com/watch?v=mVO2dcuR7P0>

# The Fibonacci Sequence - Coding Exercise

- Use **math module** in Python to compute `fibonacci(n)` and print the output as shown. Print `n` and numbers are right-justified and `fibonacci(n)` results are left-justified.
- Refer to [here](#) for the `fibonacci(n)` formula.

```
n fibonacci(n)
0 0
10 55
20 6765

200 280571172992512015699912586503521287798784
```

```
import math

def fibonacci(n):
    return None

if __name__ == '__main__':
    print(None)
    for n in range(0, 201, 10):
        fibonacci(n)
        print(None)
```

# The Fibonacci Sequence - Coding Exercise

- **Idea:** Rather computing the same terms repeatedly, save them in a dictionary and reuse them whenever necessary. This technique is called **memoization**
  - For example, fibo\_memo has the following elements when  $n = 0 \sim 11$ .  
`{ 0: 0, 1: 1, 2: 1, 3: 2, 4: 3, 5: 5, 6: 8, 7: 13, 8: 21, 9: 34, 10: 55 }`
- Rewrite fibo() using a memoization and a ternary operator to replace 'None'.

```
fibo_memo = {}  
def fibo(n):  
    if n not in fibo_memo:  
        None  
    return None
```

← compute Fibonacci for n and save the result in fibo\_memo  
← simply return the n's value in fibo\_memo

```
def fibo(n):  
    """Assume n >= 0 """  
    if n < 2:  
        return 1  
    return fibo(n-1) + fibo(n-2)
```

# The Fibonacci Sequence - Coding Exercise

- Make the following code complete by replacing the 'print(None)' to reproduce the output shown. Notice that n and numbers are right-justified and fibo(n) results are left-justified.

```
n fibo(n)

```

## Summary

---

- Recursion uses the system stack.
- We may use the memoization to speed up the recursive calls in some cases.

# 학습 정리

- 1) 재귀함수는 stack을 이용한다
- 2) Memoization은 파이썬 딕셔너리를 이용해 값을 저장하여 다시 사용할 수 있게 만든다
- 3) Memoization을 활용하면 컴퓨터가 같은 작업의 반복을 방지하여 재귀를 수행하는 속도를 높인다

# 파이썬으로 배우는 데이터 구조

수고했습니다  
곧 다음 시간에  
다시 뵙겠습니다
